UI-E-CRO is a cDNA library containing the following
tissue(s): eye anterior segment. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is AATGCCGCAT. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                118

/note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; lst strand cDNA was prepared from pooled lung tumor tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo. "

/note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from pooled lung tumor tissue, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo. "

/note="Organ: Stomach; Vector: pTZ18RP1; Site_1: EcoRI;
Site_2: NotI; The poly (A)+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Topl0F' by electroporation method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     BM746729 ST 04-MAR-2002 K-EST0021071 S3SNU16 Howo sapiens cDNA clone S3SNU16-19-D01 5',

/clome lib and the phosphatase (EAP) ind the decapped with tabacco acid pyrchhosphatase (EAP). The decapped intact mRNA was synthesized from oligo dT-selected mRNA by priming with M-tailed vector. The cDNA vector was circularized with E. coli DNA ligase after digsestion of ECORI which site is also included in vector. An RNA strand obtained cDNA vectors were used for transformation of competent cells E. coli Toplof" by electroporation method. The CDNA libraries constructed by this method are full-length enriched cDNA library. After analyzing and sequencing about 2,000 -3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including Ty promotor as 5' primer and N(dT)14 as 3' primer. The PCR products were used as template for synthesis of biotinylated single stranded RNA by brids by centrifuge, the subtracted cDNA library and incubated with aridin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA library and intoubated with aridin-gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA library and intoubated with aridin-gel. Scoli Toplof' with electroporation method."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            125

intact mRNA was ligated with DNA-RNA linker including EcoR I site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The CDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOF' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

/note="Organ: Stomach; Vector: pTZ18RP1; Site_1: EcoR1; Site_2: NOtI; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (BAP) and then decapped intact mRNA was ligated with DNA-RNA linker including EcoR is by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The dT-tailed vector was adjusted to ave about 60nt. The dT-tailed vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli Topl0F' by electroporation method. The cDNA libraries constructed by this method are full-length enriched cDNA library."

tabase

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

The present invention relates to seripancrin polynucleotides, and polypeptides encoded by them. Seripancrin are members of serine protease family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a scavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancrin's intra and intermolecular interactions. The polynucleotides and polypeptides of the invention are useful for treating and diagnosing diseases such as arthritis, chronic obstructive pulmonary disorder (COPD), cancer, osteoporosis, aberrant wound healing, angiogenesis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancrin genes are useful in chromosome localisation studies, as tools for tissue expression studies and also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with seripancrin imbalance. These polypeptides are also useful as vaccines. The present sequence is a cDNA coding for seripancrin The seripancrin gene is located on human chromosome 11q22-q23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

Novel human protease molecules useful in the treatment of developmental disorders and/or cancers

Claim 8; Page 86-87; 90pp; English.

This nucleotide sequence codes for HUPPM-6 (see AAY06437), a novel human protease. HUPPM-6 cDNA was initially identified in Incyte Clone 1337018 from the colon cDNA library COLNNOT13 using a computer search for amino acid sequence alignments. The present sequence is a consensus sequence derived from overlapping and/or extended nucleic acid sequences: Incyte Clones 1271725 (TRSTTUT02), 1337018, 586982 and 588598 (UTRSNOT01). A fragment comprising nucleotides 900-949 of the present sequence can be used for hybridisation. This sequence encompasses an active site residue. Northern analysis shows expression of HUPPM-6 in gastrointesinal, and male an female reproductive CDNA libraries. Approximately 65% of these libraries are associated with neoplastic disorders, and 22% with the immune response. The invention provides 12 new human protectides encoding them (see AAX06432-43), and the polynucleotides encoding them (see AAX06432-43), and the polynucleotides encoding them (see AAX06432-43), and the vectors, host cells and methods for producing HUPM polypeptides, as well as agonists and antagonists of HUPM. Methods for treating or preventing cell proliferative disorders and immune disorders using HUPM or HUPM antagonists are claimed.

verecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer -

Claim 22; Page 353; 453pp; English

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynucleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung

```
cancer, non-small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the invention.
                                                                                                                                                                                                                                                                                                                    129
                                                                                                                                                                                                                                                                                                                                                                   189

XX

Creening drug candidates for traating colorectal cancer, comprises

determining the effect of the candidate on the expression profile gene

XX

XX

Claim 69; Fig 7; 40pp; English.

XX

The sequences given in AA12973-76 encode the colorectal cancer

Concerning proteins and have been mapped to chromosomes 2 (CGA)

and 11 (CAA8). These sequences may be used in the method of the
cancel modulating proteins and have been mapped to chromosomes 2 (CGA)

and 11 (CAA8). These sequences may be used in the method of the
canceling candidate on call that expression profile gene
canceling cAA7, CAA8 or fragments and determining the effect of the
canceling cAA7, CAA8 or tragments and determining the effect of the expression of the expression profile gene. The
canceling candidate on the expression of the expression profile gene
candidate on the expression of the expression profile gene
candidate on the expression of the expression profile gene
candidate colorectal cancer drug. An antibody to CGA7 or CUA8 can inhibit
can agent that can interfere with the binding of CGA7 or CUA8 can cancer. The
antibody or a fragment of it is used to localize a therapeutic group is
a colorectal cancer tissue, where the therapeutic group is a cyctoxic
cantibody or a fragment of it is used to localize a therapeutic group is
a colorectal cancer in a cell. Nucleic acid segments encoching CGA7 or
CUA8 are used to elicit an immune response. CGA7 or CUA8 is used to
colorectal cancer in a cell. Nucleic acid segments encoching CGA7 or
CUA8 are used to elicit an immune response. CGA7 or CUA8 is used to
determine the prognosis of an individual with colorectal cancer.

Human; ovarian cancer; marker; cancer; familial history; brain disorder; central nervous system disorder; bacterial meningitis; viral meningitis; Alzheimer's disease; Parkinson's disease; cerebral oedema; hydrocephalus; brain herniation; inflammation; encephalitis; testicular disorder; nontuberculous granulomatous orchitis; connective tissue disorder; heart disorder; ischaemic heart disease; atherosclerosis; neoplasm;

The present invention relates to a new method for assessing whether a patient is afflicted with ovarian cancer. The method involves comparing the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where of expression of the marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the characterising cancer, in detecting the presence of cancer as early as possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing ovarian cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and central nervous system disorders (e.g. brain enhingitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. brain meningitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. nontuberculous granulomatous orchitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disorders (e.g. ischaemic heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be used in assessing the histological type of neoplasm associated with ovarian cancer, monitoring the progression of ovarian cancer, monitoring the progression of ovarian cancer, monitoring the progression of ovarian cancer. The metastasize, selecting a composition for inhibiting ovarian cancer or at risk of developing ovarian cancer or at risk of developing ovarian cancer markers concerned in the invention. Assessing whether a patient is afflicted with ovarian cancer, useful ir assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and Kovatis SG; ), Mills GB; gene; Monahan JE, Gannavarapu M, Hoersch S, Kamatkar S, Ko Meyers RE, Morrisey MP, Olandt PJ, Sen A, Vieby PO, Bast RC, Lu K, Schmandt RE, Zhao X, Glatt K; marker; histological type; carcinogenic; ovarian cancer Disclosure; Page 438; 481pp; English 14-MAR-2001; 2001US-276025P. 14-MAR-2001; 2001US-276026P. 10-AUG-2001; 2001US-311732P. 19-SEP-2001; 2001US-323580P. 26-SEP-2001; 2001US-324967P. 26-SEP-2001; 2001US-325102P. 26-SEP-2001; 2001US-325102P.                                                                                 cion relates to an isolated and purified nucleic acid that serine protease called D-G protein. The activity of the protein vention may be described as cytostatic, antiinflammatory, gical and anticoagulation. The serine protease of the invention are of the trypsin/chymotrypsin-like (S1) serine protease family, an important role in processes such as digestion and y amplification cascades through the proteolytic activation of zymogen precursors. Protease D-G modulating compounds are usefuling a condition which is mediated by protease D-G, e.g. cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   id encoding a serine protease called D-G protein which is identifying modulators that are useful for treating a which is mediated by protease D-G, e.g. cancer, skin or neuropathic pain -

skin disorders, neuropathic pain, inflammatory disorders, or coagulation diathesis/thrombosis. The polynucleotide encoding the protease is useful for identifying, detecting or isolating mutant forms of DNA molecules encoding the protease. The protease is useful for identifying modulators of the functional protease. The D-G protein can be used for formulation of compositions for laundry detergents and skin care products. Protease D-G gene therapy may be used to introduce protease D-G into the cells of target organisms. As the D-G protein is derived from a human, it is less likely to produce an allergic reaction in sensitive individuals when used in formulations for laundry detergents and skin care products. The current sequence represents the human serine protease D-G cDNA.
                                                                                                                                                                                                                                                                                                                                                                     336
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100

serine procease Seripancrin, useful for treating is, arthritis, chronic obstructive pulmonary disease, tory disorders, stroke, angiogenesis and aberrant cancer, qsteoporosis, ¿ diabetes, inflammatory wound healing extracellular

45pp; English. Disclosure; Page 40-42;

of the invention are useful for treating and diagnosing diseases such as arthritis, chronic obstructive pulmonary disorder (COPD), cancer, osteoporosis, aberrant wound healing, angiogenesis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancrin genes are useful in chromosome localisation studies, as tools for tissue expression studies and also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with seripancrin imbalance. These polypeptides are also useful as vaccines. The present sequence is a DNA coding for seripancrin variant #1 protein. The seripancrin gene is located on human chromosome 11q22-q23. The present invention relates to seripancrin polynuclectides, and polypeptides encoded by them. Seripancrin are members of serine protease family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a scavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancrin's intra and intermolecular interactions. The polynucleotides and polypeptides of the invention are useful for treating and diagnosing diseases

The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium, carmal microvascular endothelium, keratinocyte endothelium, menmeary epithelium, pulmonary artery cendthelium, momentium microvascular endothelium, prostate endothelium, prostate endothelium, renal epithelium, renal proximal tubule epithelium, canal cortical epithelium, renal proximal tubule epithelium, muscle, neonatal dermal fibroblast, pulmonary artery smooth muscle, messangial cells, skeletal muscle, astrocytes, dermal fibroblast, neural progenitor cells, skeletal muscle, astrocytes, cortic smooth muscle, mesangial cells, coronary artery smooth muscle, bronchial smooth muscle, uterine smooth muscle, lung fibroblast, corpusts of corpusts or prostate stromal cell. The gene expression profile is used for determining the level of RNA expression for a sample, determining the level of RNA expression. The gene or a protein expression profiles may provide meaningful information with respect to tumour type profiles may provide meaningful information with respect to tumour type and stage, treatment methods, and prognosis. The gene or protein expression profile may also be used for creating microarrays. The microarray is useful for genetic and physical mapping of erganisms, sequencing, genetic or medical diagnosis, genotyping of organisms, confirming cell or tissue identifications and in identifying promising antibiotics, antiviral or antifungal agents.

Diagnosing, staging, monitoring, imaging and treating cancer especially gynecological cancers e.g. breast, ovarian cancer and lung cancer, involves measuring cancer specific gene levels in cells and body fluids

Claim 9; Page 45-46; 58pp; English.

The invention relates to detecting, diagnosing metastasis and staging cancer by measuring levels of cancer specific genes (CSG) in cells, tissues or body fluids. Their remission and progression, decreases and increases in CSG levels, is also monitored, by periodic sample analysis. The methods are useful for detecting cancers, especially gynecologic cancers which include ovarian, breast, endometrial and uterine cancer and lung cancer. Antibodies against the CSGs labeled with paramagnetic ions or a radioisotope is useful for imaging cancer and when conjugated with a cytotoxic agent are useful for treating cancer. The present sequence represents a CSG sequence (clone ID: 1283171 and

```
The invention relates to transmembrane serine proteases and their corresponding nucleotides and the protease domain of a type-II membrane-type serine protease (MTSP). MTSP is useful for identifying compounds that modulate or inhibits its proteolytic activity and for formulating a medicament for treating neoplastic disease. MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in gene therapy. The present sequence is a DNA encoding human transmembrane protease, serine 4 (TMPRSS4) protein.
                                                                                                                                                         Human; transmembrane serine protease; membrane-type serine protease; MTSP; protease domain; neoplastic disease; tumour; cancer; cytostatic; lung carcinoma; colon adenocarcinoma; ovarian carcinoma; gene therapy; TMPRSS4; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             peptide comprising protease domain of type-II ofease or its catalytically active portion preventing cancer and tumor

These sequences may be used in the method of the invention for screening drug candidates. The method comprises adding a drug candidate to a cell that expresses an expression profile gene encoding CGA7, CJA8 or fragments and determining the effect of the drug candidate on the expression of the expression profile gene. The new methods are used to screen bioactive agents for the ability to bind to or modulate the activity of CGA7 or CJA8 and evaluate the effect of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          treating colorectal cancer, comprises candidate on the expression profile gene

candidate colorectal cancer drug. An antibody to CGA7 or CJA8 can inhibit the activity of CGA7 or CJA8, respectively, and is used to screen for an agent that can interfere with the binding of CGA7 or CJA8 to the antibody. The antibody can be used to treat colorectal cancer. The antibody or a fragment of it is used to localize a therapeutic group to a colorectal cancer tissue, where the therapeutic group is a cytotoxic agent or a radioisotope. Antisense molecules are used to inhibit colorectal cancer in a cell. Nucleic acid segments encoding CGA7 or CJA8 are used in a biochip. CGA7, CJA8 or a nucleic acid encoding it are used to elicit an immune response. CGA7 or CJA8 is used to determine the prognosis of an individual with colorectal cancer. Nucleic acid encoding CGA7 or CJA8 can be used in vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             516
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         576
                                                                                                                                                                                                                     The invention describes a method of diagnosing colorectal cancer comprising determining the expression of a gene encoding CJA8 or its fragment in a first colon tissue of an individual, and comparing the expression of the gene to the expression of the gene in normal tissue from the individual or in tissue from a second unaffected individual. A difference in the expression indicates that the first individual has colorectal cancer. The CJA8 genes and proteins are useful for diagnosing and prognosticating colorectal cancer. The methods are also useful for screening candidate bioactive agents that can modulate colorectal cancer, or for treating or inhibiting colorectal cancer in a patient e.g. by gene therapy. This sequence encodes the human colorectal cancer modulating protein CJA8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         396

                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to transmembrane serine proteases and their corresponding nucleotides and the protease domain of a type-II membrane-type serine protease (MTSP). MTSP is useful for identifying compounds that modulate or inhibits its proteolytic activity and for formulating a medicament for treating neoplastic disease. MTSP and its corresponding nucleotides are useful in preventing or treating tumours or cancers such as lung carcinoma, colon adenocarcinoma and ovarian carcinoma, in diagnostics and in hybridisation assays. MTSP is useful as a diagnostic marker for tumour development, growth and/or progression and as immunogens to generate antibodies that specifically bind to it. MTSP DNA is useful in a yeast two-hybrid system and in gene therapy. The present sequence is a DNA encoding human MTSP3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CysGlyGlnProLeuHisPhelleProArgLysGlnLeuCysAspGlyGluLeuAspCys

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61
                                                                                                          AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
              New mammalian DNA sequences encoding transmembrane, receptor or secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ValArgLeuSerLysAspArgSerThrLeuGlnValLeuAspSerAlaThrGlyAsnTrp

Sequences AAS45925-AAS46231 represent DNA molecules encoding and PCR primers for PRO polypeptides of the invention. The sequences of the invention can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals and to screen for modulators of the compounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         576 G; 419 T; 0 other;
